

By: Carona

S.B. No. 1673

A BILL TO BE ENTITLED

AN ACT

relating to the sanitization processes prior to the sale, transfer, or disposal of computers, computer peripherals, and computer software or other Information Technology devices.

BE IT ENACTED BY THE LEGISLATURE OF THE STATE OF TEXAS:

SECTION 1. Chapter 2054, Government Code, is amended by adding Subchapter K to read as follows:

SUBCHAPTER K. INFORMATION TECHNOLOGY DEVICE
SANITIZATION PROCESSES

Sec. 2054.401. DEFINITIONS. In this subchapter:

(1) "Clearing" means the process of deleting the data on the media before the media is reused. It is important to note that clearing will allow for the retrieval of information if certain retrieval procedures are used and is not approved for computer equipment or media that contain sensitive and/or confidential data.

(2) "Coercivity" means magnetic media is divided into three types (I, II, III) based on their coercivity. Coercivity of magnetic media defines the magnetic field necessary to reduce a magnetically saturated material's magnetization to zero. The level of magnetic media coercivity must be ascertained before executing any degaussing procedure.

(3) "Degauss" means the procedure that reduces the magnetic flux on media virtually to zero by applying a reverse

1 magnetizing field. Properly applied, degaussing renders any
2 previously stored data on magnetic media unreadable and may be used
3 in the sanitization process. Degaussing is more effective than
4 overwriting magnetic media.

5 (4) "Degausser" means the device used to remove data
6 from magnetic storage medium.

7 (5) "DoD Sanitization Standard (5520.22-M)" means the
8 US Department of Defense standard for clearing and sanitizing data
9 on writable media.

10 (6) "Dynamic Random Access Memory (DRAM)" means the
11 most common kind of random access memory (RAM) for personal
12 computers and workstations. Unlike firmware chip DRAM loses its
13 content when the power is turned off.

14 (7) "Electronically Alterable PROM (EAPROM)" is a PROM
15 whose contents can be changed.

16 (8) "Electronically Erasable PROM (EEPROM)" means
17 user-modifiable read-only memory (ROM) that can be erased and
18 reprogrammed (written to) repeatedly through the application of
19 higher than normal electrical voltage. A special form of EEPROM is
20 flash memory.

21 (9) "Erasable Programmable ROM (EPROM)" means
22 programmable read-only memory (programmable ROM) that can be erased
23 and re-used. Eraser is caused by shining an intense ultraviolet
24 light through a window that is designed into the memory chip.

25 (10) "Flash EPROM (FEPROM)" means a non-volatile
26 device similar to EEPROM, but where erasing can only be done in
27 blocks or the entire chip.

1 (11) "Programmable ROM (PROM)" means read-only memory
2 (ROM) that can be modified once by a user.

3 (12) "Magnetic Bubble Memory" means a non-volatile
4 memory device for computers that uses magnetic bubbles for
5 recording bits. The technology was used in early 1980s but is
6 obsolete today.

7 (13) "Magnetic Core Memory" means a random access
8 memory (RAM) system that was developed at MIT in 1951. Magnetic
9 core memory replaced vacuum tubes and mercury delay lines with a
10 much more compact and reliable technology. Semiconductor memories
11 largely replaced magnetic cores in the 1970s.

12 (14) "Magnetic Plated Wire" means non-volatile memory
13 created by Honeywell in 1960s. Magnetic plated wire consists of a
14 copper conductor covered with a thin layer of highly magnetic
15 material, over which a polyurethane insulating film is enameled.

16 (15) "Nonvolatile RAM (NOVRAM)" means memory that does
17 not lose its information while its power supply is turned off.

18 (16) "Oersteds" means the unit of magnetic field
19 strength in the centimeter-gram-second system.

20 (17) "Overwriting" means a software process that
21 replaces the data previously stored on magnetic storage media with
22 a predetermined set of meaningless data. Overwriting is an
23 acceptable method for clearing; however, the effectiveness of the
24 overwrite procedure may be reduced by several factors, including:
25 ineffectiveness of the overwrite procedures, equipment failure
26 (e.g., misalignment of read/write heads), or inability to overwrite
27 bad sectors or tracks or information in inter-record gaps.

1 (18) "Overwriting Procedure" means the preferred
2 method to clear magnetic disks is to overwrite all locations three
3 (3) times (the first time with a random character, the second time
4 with a specified character, the third time with the complement of
5 that specified character).

6 (19) "Read Only Memory (ROM)" means built-in computer
7 memory containing data that normally can only be read, not written
8 to. The data in ROM is not lost when the computer power is turned
9 off. The ROM is sustained by a small long-life battery in your
10 computer.

11 (20) "Sanitizing" means the process of removing the
12 data on the media before the media is reused in an environment that
13 does not provide an acceptable level of protection for the data. In
14 general, laboratory techniques cannot retrieve data that has been
15 sanitized/purged. Sanitizing may be accomplished by degaussing.

16 (21) "Static Random Access Memory (SRAM)" means random
17 access memory (RAM) that retains data bits in its memory as long as
18 power is being supplied. SRAM is used for a computer's cache memory
19 and as part of the random access memory digital-to-analog converter
20 on a video card.

21 Sec. 2054.402. PROCEDURE FOR SALE, TRANSFERRED OR DISPOSED
22 OF COMPUTER SYSTEMS. (a) The following procedures must be
23 followed when a computer system is sold, transferred, or disposed
24 of. This policy does not supersede specific policies, directives
25 or standards required by federal or state agencies pertaining to
26 the disposal of computer equipment. The following procedures also
27 apply to contractor-supplied computers:

1 (1) before a computer system is sold, transferred, or
2 otherwise disposed of, all sensitive and/or confidential program or
3 data files on any storage media must be completely erased or
4 otherwise made unreadable in accordance with DoD standards
5 (5220.22-M) unless there is specific intent to transfer the
6 particular software or data to the purchaser/recipient;

7 (2) the computer system must be relocated to a
8 designated, secure storage area until the data can be erased;

9 (3) hard drives of surplus computer equipment must be
10 securely erased within 60 days after replacement; and

11 (4) whenever licensed software is resident on any
12 computer media being sold, transferred, or otherwise disposed of,
13 the terms of the license agreement must be followed.

14 (b) After the sanitization of the hard drive is complete,
15 the process must be certified and a record maintained as specified
16 by the agency's records retention schedule.

17 Sec. 2054.403. SANITIZATION OF HARD DRIVES. (a) there are
18 three acceptable methods to be used for the sanitization of hard
19 drives:

20 (1) overwriting;

21 (2) degaussing; and

22 (3) physical destruction

23 (b) The method used for sanitization, depends upon the
24 operability of the hard drive:

25 (1) operable hard drives that will be reused must be
26 overwritten prior to disposition. If the operable hard drive is to
27 be removed from service completely, it must be physically destroyed

1 or degaussed; and

2 (2) if the hard drive is inoperable or has reached the
3 end of its useful life, it must be physically destroyed or
4 degaussed.

5 (c) Clearing data (deleting files) removes information from
6 storage media in a manner that renders it unreadable unless special
7 utility software or techniques are used to recover the cleared
8 data. However, because the clearing process does not prevent data
9 from being recovered by technical means, it is not an acceptable
10 method of sanitizing state owned hard disk storage media.

11 Sec. 2054.404. OVERWRITING SPECIFICATION. Overwriting is
12 an approved method for sanitization of hard disk drives.
13 Overwriting of data means replacing previously stored data on a
14 drive or disk with a predetermined pattern of meaningless
15 information. This effectively renders the data unrecoverable. All
16 software products and applications used for the overwriting process
17 must meet the following specifications:

18 (1) the data must be properly overwritten with a
19 pattern;

20 (2) sanitization is not complete until three overwrite
21 passes and a verification pass is completed;

22 (3) the software must have the capability to overwrite
23 the entire hard disk drive, independent of any BIOS or firmware
24 capacity limitation that the system may have, making it impossible
25 to recover any meaningful data;

26 (4) the software must have the capability to overwrite
27 using a minimum of three cycles of data patterns on all sectors,

1 blocks, tracks, and any unused disk space on the entire hard disk
2 medium;

3 (5) the software must have a method to verify that all
4 data has been removed; and

5 (6) sectors not overwritten must be identified.

6 Sec. 2054.405. DEGAUSSING SPECIFICATIONS. The following
7 standards and procedures must be followed when hard drives are
8 degaussed:

9 (1) follow the product manufacturer's directions
10 carefully. It is essential to determine the appropriate rate of
11 coercivity for degaussing;

12 (2) shielding materials (cabinets, mounting
13 brackets), which may interfere with the degausser's magnetic field,
14 must be removed from the hard drive before degaussing; and

15 (3) hard disk platters must be in a horizontal
16 direction during the degaussing process.

17 Sec. 2054.406. PHYSICAL DESTRUCTION. Hard drives must be
18 destroyed when they are defective or cannot be repaired or
19 sanitized for reuse. Physical destruction must be accomplished to
20 an extent that precludes any possible further use of the hard drive.
21 This can be attained by removing the hard drive from the cabinet and
22 removing any steel shielding materials and/or mounting brackets and
23 cutting the electrical connection to the hard drive unit. The hard
24 drive should then be subjected to physical force (pounding with a
25 sledge hammer) or extreme temperatures (incineration) that will
26 disfigure, bend, mangle or otherwise mutilate the hard drive so it
27 cannot be reinserted into a functioning computer.

1 Sec. 2054.407. SANITIZATION OF OTHER COMPUTER MEDIA.

2 (a) If there is any risk of disclosure of sensitive data on media
3 other than computer hard drives, the appropriate sanitization
4 methods as outlined in the DoD recommended sanitization procedures
5 should be followed. Particular attention should be paid to floppy
6 disks, tapes, CDs, DVDs, and optical disks.

7 (b) Memory components should also be sanitized before
8 disposal or release. Memory components reside on boards, modules,
9 and sub-assemblies. A board can be a module, or may consist of
10 several modules and sub-assemblies.

11 (c) Unlike magnetic media sanitization, clearing may be an
12 acceptable method of sanitizing components for release. Memory
13 components are categorized as either volatile or nonvolatile, as
14 described below:

15 (1) volatile memory components do not retain data
16 after removal of all electrical power sources, and when re-inserted
17 into a similarly configured system do not contain residual data,
18 i.e. SRAM, DRAM; and

19 (2) nonvolatile memory components do retain data when
20 all power sources are discontinued. Nonvolatile memory components
21 include Read Only Memory (ROM), Programmable ROM (PROM), or
22 Erasable PROM (EPROM) and their variants. Memory components that
23 have been programmed at the vendor's commercial manufacturing
24 facility and are considered unalterable in the field may be
25 released; otherwise, DoD Sanitization Procedures must be followed.

26 Sec. 2054.408. CERTIFICATION OF SANITIZATION. Prior to
27 submitting surplus forms to the agency's appropriate

1 organizational unit, the sanitizing process must be documented on a
2 form that explicitly outlines the method(s) used to expunge the
3 data from the storage media, the type of equipment/media being
4 sanitized, and the name of the person responsible for the
5 sanitization, as well as the name and signature of their
6 supervisor. The form must be completed and a copy affixed to the
7 hard drive. The completed form must be maintained in a central
8 location designated by the agency.

9 SECTION 2. This Act takes effect January 1, 2004.
